

First & Last Touch Attribution

Complete User and Administrator Guide

Know what first brought the customer and what qualified acquisition came later.

This guide explains how to install, use, validate, maintain, and troubleshoot First & Last Touch Attribution. It is written for business users, marketing teams, sales teams, Odoo administrators, and implementation specialists. The language is practical, and each important behavior is explained with examples.

SECTION About This Guide

A visitor can discover a company through an advertisement, return through another campaign, come back directly, and only then submit a Website form. The final CRM record normally shows the current business state, but the complete acquisition context can become difficult to understand. First & Last Touch Attribution keeps two clear snapshots so the original acquisition and the latest meaningful acquisition remain visible inside Odoo.

Use this guide when you need to:

- understand the difference between First Touch and Latest Qualified Acquisition;
- install the module and confirm that standard Website CRM forms are ready;
- understand how optional-cookie consent affects browser attribution;
- read UTM values, landing pages, external referrers, and advertising click IDs;
- work with attribution on leads, opportunities, newly created customers, quotations, and Sales Orders;
- search and group records by attribution fields;
- understand merge, copy, existing-customer, and backend-create safety rules;
- investigate a record that has missing or unexpected attribution;
- prepare a safe acceptance and go-live process.

READING PATH New administrators should read Module Purpose, Before You Start, Quick Start, Website Cookie Consent, and Privacy and Data Handling first. Sales and marketing users can begin with How Attribution Works and the CRM/Sales workflow sections. Technical owners should also use the companion Technical Architecture and Operations Guide.

SECTION Module Purpose

The main business question is simple: where did this customer come from, and what meaningful acquisition touch happened later before the customer converted?

The module preserves the answer as two atomic snapshots:

- **First Touch:** the first observed Website entry that the module is allowed to capture. It can be Direct, a UTM campaign, a supported ad click, or an external referral.
- **Latest Qualified Acquisition:** the most recent meaningful acquisition touch. Direct returns and ordinary same-site navigation do not replace a known qualified acquisition.

Each snapshot can keep the acquisition time, normalized landing path, external referrer origin, UTM source, medium, campaign, term, content, and supported advertising click IDs. The snapshots can then move from a Website form into CRM, a newly created customer, and the normal opportunity-to-quotation Sales flow.

BUSINESS RESULT A prospect may enter from Google Ads, return directly, later come from LinkedIn, and finally submit a form. Odoo can keep Google as the First Touch and LinkedIn as the Latest Qualified Acquisition instead of letting the last Direct visit hide the useful marketing story.

SECTION How Attribution Works

Attribution lifecycle from Website visit to CRM and Sales

The module works inside the normal Odoo Website, CRM, and Sales lifecycle. It does not require a separate attribution SaaS and it does not replace standard Website forms.

1. A visitor opens an Odoo Website page. The page may contain UTM parameters, a supported click ID, an external referrer, or no acquisition parameters at all.
2. If optional cookies are allowed, the module captures a signed first-party state for the current website and host.
3. The first observed entry becomes First Touch. A qualified later visit can become Latest Qualified Acquisition.
4. A standard Website form creates a CRM lead or opportunity. The server applies the current attribution state without hidden attribution fields in the form.
5. When a new customer is created from that lead, the lead attribution is copied to the new customer. An existing customer is not overwritten.
6. When a quotation is created from the opportunity through the normal Sales flow, the opportunity snapshots are carried to the quotation and remain on the resulting Sales Order.

SECTION Key Concepts

Term	Meaning in this module
First Touch	The first valid Website entry captured for the visitor. It is immutable after it is stored.
Qualified Touch	A touch with at least one supported UTM value, a supported advertising click ID, or an external referrer.
Latest Qualified Acquisition	The latest qualified touch. A later Direct visit does not replace it.
Direct	A captured Website entry with no supported UTM value, no supported click ID, and no external referrer.
Atomic Snapshot	One complete touch. Values from different visits are not combined to make a synthetic source/medium/campaign record.
Landing Page	The normalized path of the captured page, for example /pricing. Arbitrary query-string data is not stored as the landing page.

Term	Meaning in this module
External Referrer	Only the scheme and normalized external host, for example <code>https://news.example</code> . Referrer path, query, and fragment are discarded.
Native Odoo UTM	The standard <code>campaign_id</code> , <code>source_id</code> , and <code>medium_id</code> behavior. The module keeps it working independently.
Canonical Attribution	The module-specific First Touch and Latest Qualified Acquisition JSON snapshots and their stored summary fields.

SECTION Before You Start

Environment requirements

- The environment must allow installation of custom Odoo add-ons.
- Website CRM and Sales CRM must be available. They are module dependencies and are installed through the normal Odoo dependency process.
- The Website form used for the business flow must create a CRM lead or opportunity when CRM attribution is expected.
- The Website must use the expected public host. Multi-website and host isolation are intentional security boundaries.
- Sales users who need to read attribution must have the standard Sales user group that grants access to the attribution fields.

Website form readiness checklist

1. Open the Website form that will create the CRM record.
2. Confirm that its action creates a CRM lead or opportunity, not only an email message.
3. Submit a normal form once without attribution testing and confirm that the CRM record is created.
4. If the Website cookie bar is enabled, confirm that the visitor can choose optional cookies.
5. Use a clean browser session for the first real attribution acceptance test.

IMPORTANT The module does not turn an arbitrary email-only Website form into a CRM form. Attribution is applied when the normal Odoo Website CRM form creates the CRM record.

SECTION Installation and Initial Access

Installation procedure

1. Place the `website_first_last_touch` directory in an Odoo add-ons path.
2. Restart the Odoo service so the add-on is visible to the registry.
3. Update the Apps list.
4. Find First & Last Touch Attribution and install it.
5. Open CRM and Sales with a Sales user and confirm that the new attribution views are available when attributed data exists.
6. Open Website settings and review the cookie-bar policy used by the site.

The module has no separate business configuration menu. Tracking behavior is automatic after installation. The main administrator decisions are the Website consent configuration, the standard Website form action, user access, and the campaign links sent to visitors.

What installation adds

- First and latest attribution JSON fields plus readable summary fields on CRM leads/opportunities, customers, and Sales Orders;
- an Attribution tab on CRM and Sales records when data is present;
- an Acquisition tab on attributed customers;

- optional attribution columns, filters, search fields, and group-by controls in CRM and Sales;
- a consent-aware frontend JavaScript capture step and a public POST capture endpoint;
- server-side Website response capture and standard Website form integration.

SECTION Quick Start

Use this controlled example to prove the complete flow with a clean browser session.

Example campaign URL

URL `/?utm_source=manual_google&utm_medium=cpc&utm_campaign=manual_campaign&gclid=MANUAL_GCLID_001`

1. Close other private/incognito windows so the test starts with a clean cookie session.
2. Open the campaign URL on the Odoo Website.
3. If the cookie banner is shown, choose the option that accepts optional cookies.
4. Wait briefly for the consent flow to finish, then continue to the Contact Us page in the same browser session.
5. Submit the Website form that creates a CRM opportunity.
6. Open the new CRM record as a Sales user and open the Attribution tab.

Expected CRM values

Field	Expected value
First Source	manual_google
First Medium	cpc
First Campaign	manual_campaign
First Click ID Type	gclid
First Click ID	MANUAL_GCLID_001
First Landing Page	/
Latest Source	manual_google
Latest Medium	cpc
Latest Campaign	manual_campaign
Latest Click ID Type	gclid
Latest Click ID	MANUAL_GCLID_001
Latest Acquisition Landing Page	/

Internal navigation to the Contact Us page does not replace this qualified acquisition. The same qualified first touch is also used as Latest Qualified Acquisition when no later qualified touch exists.

SECTION Website Cookie Consent

Attribution browser state is an optional cookie. The module follows the standard Odoo Website optional-cookie decision instead of creating a separate consent system.

When the cookie bar is enabled

Visitor choice	Attribution behavior
Optional cookies accepted	The module may create or update the signed attribution cookie and continue tracking qualified Website acquisition touches.
Essential / required cookies only	The module does not create attribution state. If an attribution cookie already exists, it is removed on the next compatible Website interaction.

Visitor choice	Attribution behavior
No decision yet	Optional-cookie capture is not allowed, so no attribution cookie is written.

Why capture can happen after consent

When the visitor accepts optional cookies on the landing page, the module sends one small POST request with the current page and document referrer. The request is deferred until the consent cookie has been persisted. This allows the server to confirm that optional cookies are allowed before writing the attribution cookie.

CONSENT LIMITATION If the visitor leaves the original landing page before giving optional-cookie consent, the module does not reconstruct the lost visit later. It records only information available when capture becomes allowed.

SECTION First Touch in Detail

Example: Direct returns do not erase known acquisition

First Touch is written once. Later visits do not replace it. This makes the first snapshot a stable answer to the question: what was the first Website entry that this module was allowed to observe for this visitor?

Possible First Touch types

Kind	Example	How First Source is shown
Direct	/welcome with no referrer or marketing parameters	Direct
UTM	/?utm_source=google&utm_medium=cpc	google
Ad click	/?gclid=ABC123	UTM source if present; click ID is stored separately
Referral	/article with referrer https://news.example/story	news.example

A Direct first touch is valid. However, Direct is not a qualified acquisition, so a Direct-only state has no Latest Qualified Acquisition until a qualified touch occurs later.

SECTION Latest Qualified Acquisition in Detail

Latest Qualified Acquisition changes only when the visitor produces a meaningful acquisition signal. This prevents ordinary navigation and Direct returns from taking credit away from a known campaign or external referral.

A touch is qualified when it contains at least one of these signals

- a supported UTM parameter;
- a supported advertising click ID;
- an external HTTP or HTTPS referrer from another host.

Update rules

- The first touch never changes.
- A later qualified touch can replace the latest qualified snapshot.
- A later Direct touch does not replace the latest qualified snapshot.
- Same-site internal navigation without marketing parameters is not treated as a new touch.
- An identical marketing fingerprint on the same landing page does not refresh the latest timestamp.
- The same campaign on a different landing page is a new qualified touch because the landing path is part of the fingerprint.
- A partial later touch stays partial. For example, `utm_campaign=summer` does not inherit an old `utm_source=google`.

ATOMIC RULE The module never fills missing fields in a later touch from an older visit. Each snapshot represents one real acquisition observation.

SECTION UTM Parameters and Click IDs

Supported UTM parameters

URL parameter	Stored summary field	Maximum captured length
<code>utm_source</code>	First/Latest Source	100 characters
<code>utm_medium</code>	First/Latest Medium	100 characters
<code>utm_campaign</code>	First/Latest Campaign	150 characters
<code>utm_term</code>	First/Latest Term	150 characters
<code>utm_content</code>	First/Latest Content	200 characters

Supported advertising click IDs

Parameter	Typical platform context	Maximum captured length
<code>gclid</code>	Google Ads click identifier	256 characters
<code>gbraid</code>	Google Ads privacy-focused identifier	256 characters
<code>wbraid</code>	Google Ads privacy-focused identifier	256 characters
<code>fbclid</code>	Meta / Facebook click identifier	256 characters
<code>msclkid</code>	Microsoft Ads click identifier	256 characters

Click ID values must use letters, numbers, dot, underscore, tilde, or hyphen after normalization. Unsupported characters are rejected. If several supported click IDs are present, the readable summary chooses the first available type in this priority: `gclid`, `gbraid`, `wbraid`, `fbclid`, `msclkid`. The complete JSON snapshot can still contain more than one supported click ID.

Values are normalized with Unicode NFKC rules, control characters are removed, repeated whitespace is collapsed, and size limits are applied before the data is accepted.

SECTION Landing Page and External Referrer

Landing page

The module stores a normalized path, for example /pricing or /contactus. Repeated slashes are normalized and the path always starts with /. Arbitrary query-string values are not stored as part of the landing page.

External referrer

Only external HTTP or HTTPS referrers are used for attribution. The stored value contains the scheme and normalized host only. Example: `https://News.Example/path/story?email=private#part` becomes `https://news.example`.

Rejected or ignored cases

- same-site referrer without marketing parameters: internal navigation, not a new touch;
- foreign-host page URL supplied as the current page: rejected;
- malformed URL that cannot be parsed safely: rejected;
- referrer using an unsupported scheme or without a valid host: ignored.

PRIVACY RESULT The module does not keep the external referrer path, query, or fragment, and it does not keep arbitrary landing-page query strings.

SECTION CRM Lead and Opportunity Workflow

Standard Website CRM forms are the main bridge from browser attribution to a business record. The Website form input filter reads the current server-side attribution state and adds it to the CRM values before the lead or opportunity is created.

What users see on the CRM form

An Attribution tab is shown to Sales users when First Touch or Latest Qualified Acquisition data exists. It contains two groups with readable fields.

First Touch	Latest Qualified Acquisition
First Touch At	Latest Acquisition At
First Source	Latest Source
First Medium	Latest Medium
First Campaign	Latest Campaign
First Term	Latest Term
First Content	Latest Content
First Click ID Type	Latest Click ID Type
First Click ID	Latest Click ID
First Landing Page	Latest Acquisition Landing Page
First External Referrer	Latest External Referrer

Direct and referral examples

- **Direct lead:** First Source is Direct; Latest Source remains empty until a qualified acquisition exists.
- **Referral lead:** First Source is the normalized referrer host, for example `news.example`; the stored referrer can show `https://news.example`.

SECTION Customer Attribution

When a new customer is created from an attributed lead or opportunity, the module freezes the current lead snapshots onto that new customer. The customer form shows an Acquisition tab to Sales users when First Touch data exists.

Important rules

- Only a newly created customer receives attribution from that lead flow.
- An existing customer linked to a lead is not overwritten with the lead attribution.
- The customer keeps the latest snapshot as it existed at customer creation. The customer is not a live browser-tracking record.
- A duplicated customer does not inherit the original customer attribution.

The customer tab labels the second column Latest at Customer Creation to make this freeze point clear.

SECTION Quotation and Sales Order Attribution

The normal opportunity-to-quotation flow carries the opportunity attribution into the new quotation. The same sale.order record then keeps the snapshots when the quotation becomes a Sales Order.

Normal Sales flow

1. Open an attributed opportunity.
2. Use the normal New Quotation action.
3. The opportunity places First Touch and Latest Qualified Acquisition into the quotation creation context.
4. The quotation displays the Attribution tab to Sales users.
5. When the quotation is confirmed, the same Sales record keeps the attribution.

Safety behavior

- Duplicating a quotation or Sales Order clears First Touch and Latest Qualified Acquisition.
- A plain backend/API sale.order create does not read a browser cookie and does not invent attribution.
- When attribution values are intentionally supplied together with an opportunity, missing First Touch can be filled from the opportunity and the latest qualified snapshot is reconciled by server timestamp.

SECTION Lead Merge and Record Copy Safety

Lead merge

When CRM leads are merged, the module treats the two snapshots as complete units. It selects the earliest valid First Touch and the latest valid qualified acquisition. It does not combine source from one lead with campaign from another lead.

Record copy

Copied record	Expected attribution result
CRM lead / opportunity	First and latest attribution are cleared.
Customer	First and latest attribution are cleared.
Quotation / Sales Order	First and latest attribution are cleared, including stale default values that may still exist in context.

WHY THIS MATTERS A duplicated business record is a new business object. Reusing the original acquisition would create false attribution, so copy=False and additional Sales copy protection are intentional.

SECTION Searching, Filtering, and Grouping

CRM and Sales search views expose practical attribution fields so users can find records without opening each form.

Searchable fields

- First Source
- Latest Source
- Latest Campaign
- Latest Click ID

Quick filters

- **Attributed:** records with a First Touch timestamp.
- **Has Ad Click ID:** records where the first or latest snapshot contains a supported advertising click ID.

Group By

- First Source
- Latest Source
- Latest Campaign

Optional list columns are also available for First Source, Latest Source, Latest Campaign, Latest Acquisition At, Latest Click ID Type, and Latest Click ID. CRM shows Latest Source by default; the other new list columns are optional.

SECTION Native Odoo UTM Compatibility

The module does not replace the standard Odoo campaign, source, and medium fields. Standard Website UTM behavior continues to fill `campaign_id`, `source_id`, and `medium_id` according to Odoo rules.

The module-specific First/Latest fields have a different purpose: they keep one atomic acquisition snapshot. Native Odoo UTM cookies may have their own independent per-parameter behavior, while this module keeps the exact values that belonged to one captured touch together.

RECOMMENDED USE Keep using native Odoo campaign/source/medium reporting where it already serves the business. Use the First/Latest fields when you need a stable first touch, a qualified latest acquisition, landing/referrer context, or advertising click IDs.

SECTION Security and Visibility

Attribution data is restricted to the standard Sales user group used by the module. The fields themselves are group-protected, not only hidden in the view.

User type	Attribution field access
Public website user	No access to CRM/Sales attribution fields.
Internal user without Sales access	No access to the attribution fields through <code>fields_get</code> .
Sales user	Can read the attribution fields and related CRM/Sales views according to normal record access.
Administrator	Can manage installation and inspect records according to normal Odoo administration rights.

The module does not grant broader access to CRM leads, customers, or Sales Orders. Standard Odoo record rules and application permissions remain in effect.

SECTION Privacy and Data Handling

The module is designed to preserve useful acquisition context while limiting browser data collection.

Browser cookie

- one signed cookie per website, named `odoo_ft_<website_id>`;
- host-only by default; no parent-domain sharing;
- `HttpOnly` and `SameSite=Lax`;
- Secure when the current request is HTTPS;
- classified as optional for normal writes;
- default retention of 31 days;
- hard signed-token size limit of 3,500 characters;
- the signature detects modification but does not encrypt the marketing values.

Data the module does not use for attribution

- IP address;
- user agent;
- browser fingerprint;
- Website form email address;
- Website form phone number.

Data minimization

The landing page keeps only the normalized path. External referrers keep only scheme and host. Arbitrary query strings are not stored. UTM values and click IDs are allowlisted, normalized, size-limited, and stripped of control characters.

BUSINESS RESPONSIBILITY Public URL paths and UTM parameters are business-controlled data. Do not place personal data or secrets in public page paths, campaign parameters, or advertising click parameters.

SECTION Multi-Website Behavior

Each Website receives its own cookie name through the website ID. The signed state also contains the website ID and normalized current host. A token created for one website or host is rejected when it is presented as state for another website or host.

This isolation prevents one Website from silently reusing another Website attribution state. It also means that changing domains or moving traffic between hosts should be included in acceptance testing.

SECTION Daily User Workflow and Examples

Salesperson workflow

1. Open a lead, opportunity, quotation, Sales Order, or attributed customer.
2. Open the Attribution or Acquisition tab when it is present.
3. Read First Touch to understand the original observed Website entry.
4. Read Latest Qualified Acquisition to understand the latest meaningful acquisition before conversion.
5. Use the native campaign/source/medium fields as normal when standard Odoo reporting is needed.
6. Use search filters or group-by fields when reviewing many attributed records.

Example A - Google first, LinkedIn latest

Snapshot	Example
First Touch	google / cpc / spring; term odoo; content hero; gclid G_CRM_1; landing /crm
Latest Qualified Acquisition	linkedin / paid_social / retarget; content pricing; fbclid F_CRM_2; landing /pricing

Example B - Direct only

A visitor first opens /welcome directly and submits a form without any later qualified acquisition. First Source is Direct and Latest Qualified Acquisition remains empty.

Example C - External referral

A visitor opens /article from https://news.example/path/story. The stored referrer is https://news.example, the readable source is news.example, and the referrer path/query/fragment are not retained.

SECTION Troubleshooting

Symptom	Likely reason	What to check
CRM record was not created	The Website form action may be sending email instead of creating a CRM lead/opportunity.	Check the Website form action and prove standard CRM form creation first.
Lead exists but Attribution tab is missing	No First/Latest data was stored, or the user does not have Sales access.	Check the record with a Sales user; then review consent and the browser capture flow.
Campaign URL ends as Direct	Attribution capture may have happened after the campaign visit was lost, or optional cookies were not allowed.	Repeat in a clean browser session; accept optional cookies on the campaign landing and confirm the attribution cookie exists before submitting the form.
Latest Source became empty but Latest Campaign exists	A later touch contained only campaign or click-ID data.	This is atomic behavior; the later snapshot does not inherit source from an older visit.
Direct return did not update Latest	Expected behavior. Direct is not a qualified acquisition.	Read the existing Latest Qualified Acquisition.
Existing customer has no new attribution	Expected safety behavior. Existing customers are not overwritten.	Review the lead attribution instead; a new customer created from a lead receives the freeze.
Copied quotation has no attribution	Expected safety behavior. Copies clear attribution.	Create the quotation from the attributed opportunity instead of duplicating an old quotation.
Backend-created Sales Order has no attribution	Expected when browser state was not intentionally propagated.	Use the normal opportunity-to-quotation flow or explicitly implement a supported integration.
Wrong website or host does not reuse cookie	Expected isolation behavior.	Retest on the target website/host with a fresh acquisition visit.
Native UTM exists but First/Latest is empty	Native UTM and module attribution are separate flows.	Check optional-cookie consent and whether the CRM record was created through the supported Website form flow.

Browser-level diagnostic order

1. Start a clean private/incognito session.
2. Open a known campaign URL.
3. Accept optional cookies when the banner is enabled.
4. In browser storage, confirm that website_cookies_bar allows optional cookies and that odoo_ft_<website_id> appears.
5. In Network, confirm that /website/first-last-touch/capture returns HTTP 200 after consent when the explicit capture path is used.
6. Submit the standard Website CRM form in the same session.

7. Open the resulting CRM record with a Sales user and compare First/Latest values with the campaign URL.

SECTION Scope and Limitations

The module has a focused purpose. It preserves first and latest qualified Website acquisition context through supported CRM and Sales flows. It is not a full advertising analytics platform.

- No offline conversion upload to advertising platforms.
- No Google, Meta, or Microsoft Ads API integration.
- No GA4 Measurement Protocol or Google Tag Manager integration.
- No ad-spend, revenue-attribution dashboard, ROAS, or CAC calculation.
- No multi-touch history ledger beyond First Touch and Latest Qualified Acquisition.
- No channel-classification model beyond the captured source/referrer values.
- No cross-device identity resolution.
- No external WordPress form capture.
- No Events attribution integration.
- No automatic attribution stamping for eCommerce checkout orders in the base module.
- No overwrite of an existing customer with a new lead acquisition.
- No attribution inheritance when business records are duplicated.
- No reconstruction of a campaign visit that occurred before optional-cookie consent was granted.

SECTION Frequently Asked Questions

Does First Touch always mean a campaign?

No. The first observed entry can be Direct, a UTM visit, an ad click, or an external referral.

Why can First Source be Direct while Latest Source is a campaign?

A visitor may first arrive directly and later return through a qualified acquisition. First Touch stays Direct; the later qualified visit becomes Latest Qualified Acquisition.

Why does a later Direct visit not become Latest?

Direct is intentionally not a qualified acquisition. This prevents ordinary returns from erasing the last known campaign or referral.

Can a later partial UTM touch inherit old values?

No. Each snapshot is atomic. A later `utm_campaign` value does not borrow an old `utm_source` or `utm_medium`.

Does the module replace standard Odoo UTM fields?

No. Native campaign, source, and medium behavior remains unchanged.

Does the module need hidden Website form fields?

No. Standard Website CRM forms are stamped on the server.

Does an existing customer receive attribution from every new lead?

No. Existing customers are not overwritten. A newly created customer can receive the lead freeze.

What happens when two leads are merged?

The earliest valid First Touch and latest valid qualified snapshot are selected as complete snapshots.

What happens when a quotation is duplicated?

The copy does not inherit attribution.

Can a non-sales internal user read the attribution fields?

No. The fields are restricted to the standard Sales user group used by the module.

Is the cookie encrypted?

No. It is signed to detect tampering. Marketing values inside the signed token are not encrypted.

Does the module track IP address or fingerprint the browser?

No.

How long does the browser cookie live?

The default retention is 31 days, subject to browser behavior and consent changes.

Can one website reuse another website cookie?

No. The cookie name is website-specific and the signed state validates both website ID and host.

SECTION Administrator Checklists

Initial setup checklist

- Module installs without manual database changes.
- Website form creates a CRM lead/opportunity.
- Cookie-bar policy is understood by the business owner.
- A clean campaign visit creates the expected signed attribution cookie after optional consent.
- The CRM record shows expected First and Latest values.
- A Direct-only record shows First Source = Direct and no Latest Qualified Acquisition.
- An external referral stores only origin and normalized landing path.
- New customer creation receives attribution.
- Existing customer assignment does not overwrite attribution.
- Opportunity to quotation carries attribution.
- Copied lead/customer/quotation clears attribution.
- Sales user can see fields; non-sales and public users cannot.
- Search filters and group-by controls work for the intended users.

Monthly review checklist

- Review campaign naming consistency for UTM source, medium, and campaign.
- Confirm public URLs and UTM values do not contain personal or secret information.
- Check that Website form actions still create the expected CRM record.
- Repeat one campaign-to-CRM browser test after Website or cookie-consent changes.
- Repeat opportunity-to-quotation validation after Sales customizations.
- Review Sales user access after security-group changes.
- Review multi-website host behavior after domain or reverse-proxy changes.

SECTION Support Information

Technical name: website_first_last_touch

Dependencies: website_crm, sale_crm

License: LGPL-3

Support contact: full.stack.odoo@gmail.com

When requesting support, include the Website URL pattern used for the test, consent choice, CRM record reference, First/Latest values shown in Odoo, whether the attribution cookie exists, whether the standard Website form created the expected CRM record, and any relevant server or browser-console message. Do not send passwords, session cookies, private tokens, or unrelated customer data.
